Virus WATCH
Week ending 19th November 2023

Key Points

Influenza and influenza-like illnesses (ILI)
- All indicators of ILI activity increased in the past week.
- Influenza notifications to the Department of Health decreased in the past week.
- Respiratory syncytial virus (RSV) notifications decreased in the past week.
- Total non-influenza respiratory virus detections at PathWest Laboratory Medicine (PathWest) decreased in the past week.
- COVID-19 notifications decreased to 510 cases in the past week. See COVID-19 Weekly surveillance report (health.wa.gov.au)

Gastroenteritis
- The rate of gastroenteritis presentations to sentinel GPs increased in the past week and the number of presentations to EDs decreased.
- Rotavirus notifications to the Department of Health increased in the past week and norovirus detections at PathWest decreased.

Other vaccine-preventable diseases
- **Chickenpox and shingles**: In the past week, there were no chickenpox presentations to sentinel GPs and presentations to EDs decreased. Shingles presentations to sentinel GPs increased and presentations to EDs decreased.
- **Measles**: No measles cases were notified in the past week.
- **Mumps**: One overseas acquired mumps case was notified in the past week.
- **Rubella**: No rubella cases were notified in the past week.
- **Invasive meningococcal disease (IMD)**: No IMD cases were notified in the past week.
Influenza and influenza-like illnesses (ILI)

The rate of ILI presentations to sentinel GPs increased in the past week (Figure 1).

Figure 1. Rate of ILI per 1000 consultations at sentinel GPs (Australian Sentinel Practices Research Network) in WA by week, 2018 to 2023 YTD

The rate of ILI-related presentations and admissions to EDs increased in the past week (Figure 2).

Figure 2. Number and rate of ILI presentations/admissions to emergency departments in WA in the past eight weeks

Note: This graph is a count of current EDIS data using the ICD codes B34.9 and J06.9, which are consistent with a clinical presentation of influenza-like illness. This data may differ from that presented in the Winter Respiratory Illness Report provided by the Information and System Performance Directorate, DoH.
The number of respiratory illness presentations to EDs increased in the past week to the higher range of values usually reported at this time of year (Figure 3).

**Figure 3. Number of respiratory illness presentations to emergency departments in WA by week, 2018 to 2023 YTD**

Note: This graph is a count of current EDIS data using the ICD codes B34.9, H66.9, J00, J06.9, J09.0, J10.0, J10.1, J10.8, J11.0, J11.1, J11.8, J12.9, J18.0, J18.1, J18.8, J18.9, J20.9, J21.9, J22, J40, J44.0, J44.1, J44.9, J45.9, J46.0, J98.8, J98.9, R05 and COVID-19 code U07.1, which are consistent with a clinical presentation of all respiratory-like illness. This data is different to Figure 3 but similar to that presented in the Winter Respiratory Illness Report provided by the Information and System Performance Directorate, DoH.

In the past week, 185 influenza cases were notified to the Department of Health, a decrease of 4% compared to the previous week (Figure 4).

**Figure 4. Number of influenza notifications in WA by week, 2018 to 2023 YTD**

Note: This graph is a count of all influenza notifications by week of receipt by the DoH, WA (through WANIDD) to the end of the current reporting week. The seasonal threshold defines a value above which may indicate seasonal influenza activity. The threshold value is calculated based on analysis of inter-seasonal influenza data from 2015 to 2018.
The influenza PCR test positivity remained low at 3.6% (45 detections) at PathWest in the last week. (Figure 8).

**Figure 8. Proportion of PCR positive influenza detections at PathWest by week, WA, 2018 to 2023 YTD**

PathWest reported 45 influenza detections in the past week; 42 (93%) were influenza A (which included 11 A/H1, 22 A/H3 and 9 influenza A not yet subtyped); and 3 (7%) were influenza B (Figure 9).

**Figure 9. Number of PCR positive influenza detections at PathWest by type, subtype and week, WA, 2022 to 2023 YTD**

Note: The graph is a summary of all WA samples positive for influenza reported at PathWest, excluding samples referred by other private laboratories for influenza subtyping. These samples were tested using a rapid testing method that does not determine the influenza subtype (i.e., influenza A/H3N2 or A/H1N1).
In the past week, 50 respiratory syncytial virus (RSV) cases were notified in WA, a decrease of 7% compared to the previous week (Figure 10).

**Figure 10. Number of respiratory syncytial virus (RSV) notifications by week, WA, 2022 to 2023 YTD**

Non-influenza respiratory virus detections at PathWest decreased in the past week (Figure 11). The most common non-influenza respiratory virus detected was human metapneumovirus (53 cases).

**Figure 11. Number of non-influenza respiratory virus detections at PathWest by week, WA, 2022 to 2023 YTD**

---

Note: Respiratory syncytial virus (RSV) was made a notifiable infectious disease in WA in July 2021. This graph is a count of all RSV by week of onset by the DoH, WA (through WANIDD) to the end of the current reporting week.

Note: This graph is a count of all WA samples positive for a common respiratory virus other than influenza reported by PathWest.
In the past week, 510 COVID-19 PCR positive cases were notified in WA, an decrease of 4% in comparison to the previous week. (Figure 12).

Figure 12. Number of COVID-19 cases in WA by test type and notification date, 2022 to 2023 YTD

Gastroenteritis

The rate of gastroenteritis presentations to sentinel GPs increased in the past week but remained below the baseline (Figure 14).

Figure 14. Number of gastroenteritis presentations per 1000 consultations at sentinel GPs (Australian Sentinel Practices Research Network) in WA by week, 2018 to 2023 YTD

Notes: Data sourced from Public Health Operations COVID-19 Unified System (PHOCUS); Notification date is to the 6pm reporting period
From 9th October 2023, COVID-19 cases detected by Rapid Antigen Test (RAT) were no longer counted due to the closure of the online RAT registration system
Gastroenteritis presentations at EDs decreased in the past week to the lower range of values usually reported at this time of year (Figure 15).

**Figure 15. Number of gastroenteritis presentations to Emergency Departments in WA by week, 2018 to 2023**

In the past week, statewide rotavirus notifications to the Department of Health increased and norovirus detections at PathWest decreased (Figure 16).

**Figure 16. Number of rotavirus notifications to the Department of Health and norovirus detections at PathWest in the past eight weeks**

Note: Rotavirus notifications reported to the Department of Health include detections from all WA pathology laboratories. Norovirus detections are from PathWest only.
Viral rashes

There were no chickenpox presentations to sentinel GPs in the past week and the rate of shingles presentations increased (Figure 17).

**Figure 17. Number of varicella-zoster presentations per 1000 consultations at sentinel GPs (Australian Sentinel Practices Research Network) in WA in the past eight weeks**

![Graph showing number of varicella-zoster presentations per 1000 consultations at sentinel GPs in WA in the past eight weeks.](image)

Note: Baseline levels for chickenpox and shingles presentations to WA ASPREN GPs per thousand consultations were calculated using the mean of weekly WA ASPREN data from week 1, 2018 to week 52, 2022.

Chickenpox and shingles presentations to EDs decreased below baseline levels in the past week (Figure 18).

**Figure 18. Number of varicella-zoster presentations to Emergency Departments in WA in the past eight weeks**

![Graph showing number of varicella-zoster presentations to Emergency Departments in WA in the past eight weeks.](image)

Note: Baseline levels for varicella-zoster virus presentations to Emergency Departments in WA were calculated using the mean of weekly EDIS data from week 1, 2018 to week 52, 2022.
Report Notes

Virus Watch is a weekly electronic publication by the Communicable Disease Control Directorate (CDCD) and key collaborators. It provides a brief summary of general practice and hospital emergency department sentinel surveillance data on influenza-like illness, gastroenteritis, and varicella-zoster disease, together with relevant laboratory information, to alert health care workers in WA about important circulating viruses. All figures and data were accurate at time of publication, but subject to change. Please note that the influenza and ILI surveillance systems in Western Australia (WA) have been impacted by the COVID-19 pandemic. Therefore, respiratory viral activity should be interpreted with caution and take into account the effects of changes in health seeking behaviour including accessing alternate health services such as telehealth, focused testing for COVID-19 at COVID-19 clinics or specific acute respiratory infection clinics, increased testing for other respiratory viruses and the impact of international border closures. The data collections used to create this publication include:

- Sentinel general practice (GP) data collected by WA members of the Australian Sentinel Practices Research Network (ASPREN).
- Emergency Department (ED) data provided by the Emergency Department Information System (EDIS), which currently incorporates data from the following hospitals: Fiona Stanley Hospital, Sir Charles Gardiner Hospital, Royal Perth Hospital, Perth Children’s Hospital, King Edward Memorial Hospital, St John of God Midland, Bunbury Hospital, Armadale Hospital, Joondalup Health Campus, and Rockingham General Hospital.
- Disease notification data are sourced from the Western Australian Notifiable Infectious Diseases Database (WANIDD). These data are received by CDCD, WA Department of Health from medical providers and public or private laboratories in WA. Hospitalisation data are included in the report during the influenza season.
- Viral laboratory data obtained from PathWest laboratories at QEII Medical Centre, as well as via notification data sent by all WA laboratories to CDCD, WA Department of Health.
- As of 1 January 2022, the definition of a confirmed influenza case has changed to remove ‘Single high titre by CFT or HAI to influenza virus’ from the list of laboratory definitive evidence.
- As of March 2022, this report includes COVID-19 cases diagnosed by Polymerase Chain Reaction (PCR) test and Rapid Antigen Test (RAT) sourced from Public Health Operations COVID-19 Unified System (PHOCUS).
- From 9 October 2023, it is no longer a requirement to register positive COVID-19 rapid antigen test (RAT) results to the WA Department of Health. Therefore, probable COVID-19 cases diagnosed by RAT will not be reported from that date.

This document can be made available in alternative formats on request for a person with disability.
