

# Syphilis testing in pregnancy

Patient information

#### **Acknowledgement of Country**

We acknowledge the Aboriginal people of the many traditional lands and language groups of Western Australia and pay respect to their elders past and present. North Metropolitan Health Service recognises, respects and values Aboriginal cultures as we walk a new path together.

## **Pregnant or planning pregnancy?**

Get tested for syphilis as soon as you know you are pregnant.

### What is syphilis?

**Syphilis** is a sexually transmitted infection. There is currently a syphilis outbreak in WA.

Common symptoms of syphilis are shown (left), but some people have no symptoms (right).

#### What is congenital syphilis?

When a pregnant woman has a syphilis infection, syphilis can pass to her unborn baby. This can cause miscarriage, premature birth and harm to the baby, occasionally resulting in the baby's death. Treatment can prevent this. This is why testing is so important.

## **Syphilis testing**

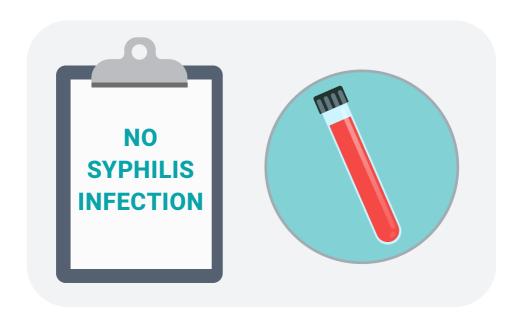

All pregnant women should be tested for syphilis at least three times during pregnancy:

- 1. At first doctor's visit
- 2. At 28 weeks
- 3. At 36 weeks.

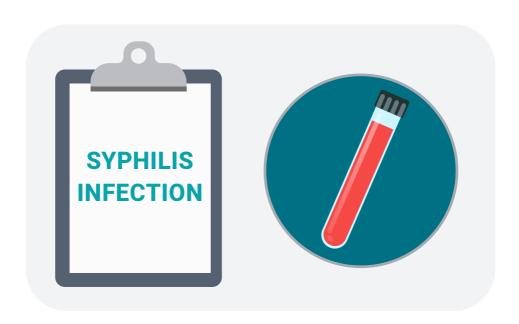

#### If you do **not** have syphilis

If your test shows you do not have syphilis, you still need to be tested regularly during your pregnancy. If symptoms (see page 5) develop, tell your doctor/midwife and have extra testing.

If your test shows you have syphilis, you will need treatment and have more frequent testing. Your doctor or midwife will explain this.

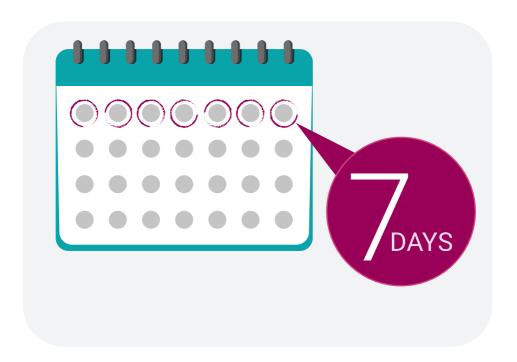

#### **Syphilis treatment**

Antibiotics are used to treat syphilis and can prevent the baby becoming infected.

Do not have any sexual activity until seven days after you and your partner/s have been treated.

Your doctor or midwife will arrange follow-up testing to make sure the antibiotics have worked.

You will be asked about who you have had sex with. It is very important that they get a blood test and treatment.

This will stop you getting reinfected with syphilis and

protect your baby.

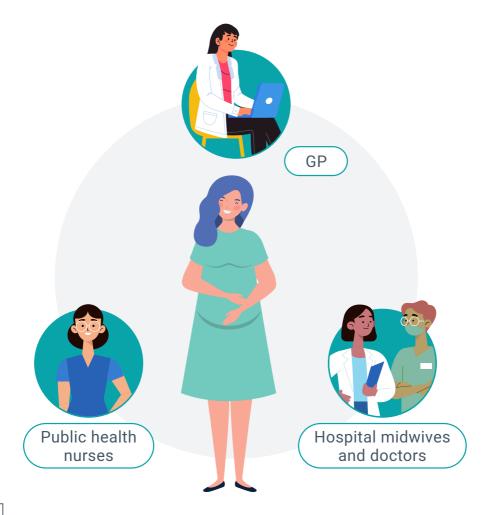

If you think you have been reinfected with syphilis, speak to your doctor or midwife as soon as you can.

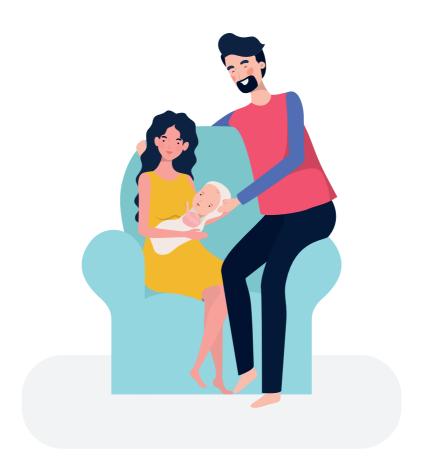

The management will include:

You will be looked after by a team, such as your GP, hospital midwives and doctors, and public health nurses who might call to check how you're going. We work together to look after you and your pregnancy.

After you have your baby, your healthcare team will check on you and your baby before you go home and may arrange follow-up appointments.
