

Pre-vaccination screening checklist

	checklist helps your immunisation provider make decisions at vaccinating you or your child today.			
Please indicate if the person to be vaccinated:				
	is unwell today			
	has a disease that lowers immunity (e.g. leukaemia, cancer, HIV/AIDS) or is having treatment that lowers immunity (e.g. oral steroid medicines such as cortisone and prednisone, radiotherapy, chemotherapy)			
	is an infant of a mother who was receiving highly immunosuppressive therapy (e.g. biological disease modifying anti-rheumatic drugs (bDMARDs) during pregnancy			
	has had a severe reaction following any vaccine			
	has any severe allergies (to anything)			
	has had any vaccine in the past month			
	has had an injection of immunoglobulin, or received any blood products or a whole blood transfusion within the past year			
	is pregnant			
	has a past history of Guillain-Barré syndrome			
	was a preterm infant			
	has a chronic illness			
	has a bleeding disorder			
	identifies as an Aboriginal or Torres Strait Islander			
	does not have a functioning spleen			

	is planning a pregnancy or anticipating parenthood	
	is a parent, grandparent or carer of a newborn	
	lives with someone who has a disease that lowers immunity (e.g. leukaemia, cancer, HIV/AIDS), or lives with someone who is having treatment that lowers immunity (e.g. oral - steroid medicines such as cortisone and prednisone, radiotherapy, chemotherapy)	
	is planning travel	
	has an occupation or lifestyle factor(s) for which vaccination may be needed (discuss with doctor/nurse)	
Please specify:		

Note: Please discuss this information or any questions you have about vaccination with your immunisation provider before the vaccines are given.

Before any vaccination takes place, your immunisation provider should ask you:

- Did you understand the information provided to you about vaccination?
- - Do you need more information to decide whether to proceed?
- Did you bring your/your child's vaccination record card with you?

It is important for you to receive a personal record of your / your child's vaccinations. If you do not have a record, ask your immunisation provider to give you one. Bring this record with you every time you or your child visit for vaccination. Make sure your immunisation provider records all vaccinations on it.

Information sheet – comparison of the effects of diseases and the side effects of NIP vaccines from the Australian Technical Advisory Group on Immunisation (ATAGI). *The Australian Immunisation Handbook* 10th ed (2017 update). Canberra: Australian Government Department of Health, 2017. Full version of this available at http://www.immunise.health.gov.au/internet/immunise/publishing.nsf/Content/Handbook10-home

Effect of disease	Side effect of vaccine
Up to 1 in 7 patients die. The bacteria release a toxin, which can produce nerve paralysis and heart failure.	About 1 in 10 has local swelling, redness or pain at the injection site, or fever (DTPa/dTpa vaccine). Booster doses of DTPa may occasionally be associated with extensive swelling of the limb, but this resolves completely within a few days. Serious adverse events are very rare.
At least 7 in 10 adult patients develop jaundice (yellowing of the skin and eyes), fever, anorexia (decreased appetite), nausea, vomiting, hepatic (liver) pain and malaise (tiredness).	About 1 in 5 will have local swelling, redness or pain at the injection site. Serious adverse events are very rare.
About 1 in 4 chronic carriers will develop cirrhosis or liver cancer.	About 1 in 20 has local swelling, redness or pain at the injection site. About 1 in 50 has fever. Serious adverse events are very rare.
without treatment.	About 1 in 20 has local swelling, redness or pain at the injection site. About 1 in 50 has fever. Serious adverse events are very rare.
About 7 in 10 cervical cancers worldwide have been associated with HPV-16 and 1 in 6 with HPV-18.	About 8 in 10 will have pain and 2 in 10 will have local swelling, redness or pain at the injection site. Headache, fever, muscle aches and tiredness may occur in up to 3 in 10 people. Serious adverse events are very rare.
,	At least 7 in 10 adult patients develop jaundice (yellowing of the skin and eyes), fever, anorexia (decreased appetite), nausea, vomiting, hepatic (liver) pain and malaise (tiredness). About 1 in 4 chronic carriers will develop cirrhosis or liver cancer. About 1 in 20 meningitis patients dies and about 1 in 4 survivors has permanent brain or nerve damage. Epiglottitis is rapidly and invariably fatal without treatment.

Disease	Effect of disease	Side effect of vaccine
Influenza – virus spread by respiratory droplets; causes fever, muscle and joint pains, pneumonia. About 1 in 10 to 1 in 5 persons will get influenza every year.	There are an estimated 3,000 deaths in people older than 50 years of age each year in Australia. Causes increased hospitalisation in the very young (under 5 years of age) and the elderly. Other highrisk groups include pregnant women, people who are obese, diabetics and others with certain chronic medical conditions.	About 1 in 10 has local swelling, redness or pain at the injection site. Fever occurs in about 1 in 10 children aged 6 months to 3 years. Guillain-Barre syndrome occurs in about 1 in 1 million. Serious adverse events are very rare.
Measles – highly infectious virus spread by respiratory droplets; causes fever, cough and rash.	About 1 in 15 children with measles develops pneumonia and 1 in 1000 develops encephalitis (brain inflammation). For every 10 children who develop measles encephalitis, 1 dies and many have permanent brain damage. About 1 in 100 000 develops SSPE (brain degeneration), which is always fatal.	About 1 in 10 has local swelling, redness or pain at the injection site, or fever. About 1 in 20 develops a rash, which is non-infectious. Low platelet count (causing bruising or bleeding) occurs after the 1st dose of MMR vaccine at a rate of about 1 in 20,000 to 30,000. Serious adverse events are very rare.
Meningococcal infection — bacteria spread by respiratory droplets; causes septicaemia (infection of the blood stream) and meningitis (infection of the tissues surrounding the brain).	About 1 in 10 patients dies. Of those that survive, 1 to 2 in 10 have permanent long-term problems, such as loss of limbs and brain damage.	About 1 in 10 has local swelling, redness or pain at the injection site, fever, irritability, loss of appetite or headaches (conjugate vaccines). About 1 in 2 has a local reaction (polysaccharide vaccine). Serious adverse events are very rare.
Mumps – virus spread by saliva; causes swollen neck and salivary glands, and fever.	One in 5000 children develops encephalitis (brain inflammation). One in 5 males (adolescent/adult) develop inflammation of the testes. Occasionally, mumps causes infertility or permanent deafness.	About 1 in 100 may develop swelling of the salivary glands. Serious adverse events are very rare.

	Disease	Effect of disease	Side effect of vaccine				
	Pertussis – bacteria spread by respiratory droplets; causes 'whooping cough'; with prolonged cough lasting up to 3 months.	About 1 in 125 babies under the age of 6 months with whooping cough dies from pneumonia or brain damage.	About 1 in 10 has local swelling, redness or pain at the injection site, or fever (DTPa/dTpa vaccine). Booster doses of DTPa may occasionally be associated with extensive swelling of the limb, but this resolves completely within a few days Serious adverse events are very rare.				
	Pneumococcal infection – bacteria spread by respiratory droplets; causes septicemia (infection of the blood stream), meningitis (infection of the tissues surrounding the brain) and occasionally other infections.	About 3 in 10 people with meningitis die. One-third of all pneumonia cases and up to half of pneumonia hospitalisations in adults is caused by pneumococcal infection.	About 1 in 5 has local swelling, redness or pain at the injection site, or fever (conjugate vaccine). Up to 1 in 2 has local swelling, redness or pain at the injection site (polysaccharide vaccine). Serious adverse events are very rare.				
	Polio – virus spread in faeces and saliva; causes fever, headache and vomiting and may progress to paralysis.	While many infections cause no symptoms, up to 3 in 10 patients with paralytic polio die, and many patients who survive are permanently paralyzed.	Local redness, pain and swelling at the injection site are common. Up to 1 in 10 has fever, crying and decreased appetite. Serious adverse events are very rare.				
	Rotavirus – virus spread by faecal-oral route; causes gastroenteritis, which can be severe.	Ilness may range from mild diarrhoea to severe dehydrating diarrhoea and fever, which can result in death. Of children under 5 years of age, before vaccine introduction, approximately 10 000 children were hospitalised, 115 000 needed GP visits and 22 000 required an Emergency Department visit each year in Australia.	Up to 3 in 100 may develop diarrhoea or vomiting in the week after receiving the vaccine. About 1 in 17 000 babies may develop intussusception in the first few weeks after the 1st or 2nd vaccine doses. Serious adverse events are very rare.				

Disease	Effect of disease	Side effect of vaccine
Rubella – virus spread by respiratory droplets; causes fever, rash and swollen glands, but causes severe malformations in babies of infected pregnant women.	Patients typically develop a rash, painful swollen glands and painful joints. One in 3 000 develops low platelet count (causing bruising or bleeding); 1 in 6 000 develops encephalitis (brain inflammation). Up to 9 in 10 babies infected during the first trimester of pregnancy will have a major congenital abnormality (including deafness, blindness or heart defects).	About 1 in 10 has local swelling, redness or pain at the injection site. About 1 in 20 has swollen glands, stiff neck or joint pains. About 1 in 20 has a rash, which is non-infectious. Low platelet count (causing bruising or bleeding) occurs after the 1st dose of MMR vaccine, at a rate of about 1 in 20 000 to 30 000. Serious adverse events are very rare.
Tetanus – caused by toxin of bacteria in soil; causes painful muscle spasms, convulsions, lockjaw.	About 2 in 100 patients die. The risk is greatest for the very young or old.	About 1 in 10 has local swelling, redness or pain at the injection site, or fever (DTPa/dTpa vaccine). Booster doses of DTPa may occasionally be associated with extensive swelling of the limb, but this resolves completely within a few days. Serious adverse events are very rare.
Varicella (chickenpox) – highly contagious virus; causes low-grade fever and vesicular rash (fluid-filled spots). Reactivation of the virus later in life causes herpes zoster (shingles).	One in 100 000 patients develops encephalitis (brain inflammation). Infection during pregnancy can result in congenital malformations in the baby. Infection in the mother around delivery time results in severe infection in the newborn baby in up to one-third of cases.	About 1 in 5 has a local reaction or fever. About 3 to 5 in 100 may develop a mild varicella-like rash. Serious adverse events are very rare.
